

International Summer Camp

Digital skills

General camp set up and computers

The digital skills workshop takes place on 9 mornings, 3.5 hours a day. On the first day, the whole group will meet to go through the basics of e-safety.

In order to conveniently take home work done in the camp, we ask you to bring your own computer. Please do not forget to bring a charger and an electric converter for your computer. Which computers? All digital skills courses run on the vast majority of commercially available computers, with a preference for computers with 8GB of RAM or more. If you are buying a new computer, Microsoft's Surface may be a good option.

Knowledge required: The camp is suitable for students with all levels of digital knowledge.

Learning takes place in small groups and everyone gets to work on individual tasks suitable for their level. If you have already done Python, don't worry, we have material at many different levels to keep you interested and challenged.

Languages: The camp is taught in English, the language of code. As the instructors are bilingual, specific questions can be discussed in German and French too.

Three course options: AI, coding and robotics

1. Discover AI: From chatbots to creative machines

Dive into the exciting world of artificial intelligence (AI) with our latest course designed specifically for 12–15-year-olds. This option takes students on a journey through various types of AI, with a special focus on Large Language Models, and with an overview of Python code. Through interactive lessons and hands-on projects, students will learn how AI powers chatbots, generates creative content, and solves real-world problems. No prior coding experience is needed. Join us to discover the future of AI and how you can be a part of it.

More about Artificial Intelligence and Python

Artificial Intelligence is a technology that allows machines to think and learn like humans. Large Language Models (LLMs), like ChatGPT, use code to understand and generate human language. These AIs power chatbots, create stories, and solve problems, making our lives easier and more connected by using complex programming. Python, a popular programming language, is widely used in AI for writing the code that makes these intelligent systems work.

2. Create your own digital game with Python: Explore a powerful and fast language

Students are introduced to coding using one of the most popular professional programming languages on the market. Python is easy to pick up, whether a student is a newly minted programmer or experienced with other languages. Teens will enjoy writing short programs with Python, work on group exercises, and then build a game of their choice. For students with less programming experience, we start with Scratch and Python block code, and then move on to Python.

About Python, the language of Instagram, YouTube & Google's search engine

Widely used by programmers, designers and game developers, Python has rapidly become one of the most popular programming languages. Whatever your interests, Python is a great way to prepare for university education, as it is now taught not only in all science and engineering faculties, but also in finance, business and economics. Python is powerful and fast. It plays well with others, it runs everywhere, is friendly and easy to learn, and is open. www.python.org/about

About Scratch, MIT's introduction to computer science

For students with less programming experience, we start with Scratch. Scratch is a programming language and an online community where children can program and share interactive media such as digital stories, games, and animation with people from all over the world. As children create with Scratch, they learn to think creatively, work collaboratively, and reason systematically. Scratch is designed and maintained by the Lifelong Kindergarten group at the MIT Media Lab.

3. Robotics with Arduino: Build and program your own robot!

Robots have an increasing presence in our daily lives. Whether a student is interested in digital intelligence or is a fan of Star War's R2-D2, this course will allow him/her to build a robot and then learn hands-on robotic programming with "Arduino", a very popular robot programming language.

About Arduino Microcontroller for Robots

Arduino is an open-source platform based both on a microcontroller board and a development environment, which will enable the user to write code to interact with the environment. Be it a simple blinking LED or a more complex line-follower obstacle-avoiding robot, Arduino can do it!
